

**IN THE CLAIMS**

No amendments have been made to the claims.

1-15. (Canceled)

1           16. (Previously Presented) A reproduction apparatus, comprising:  
2           a reproduction unit for reproducing image data recorded on a recording medium;  
3           a memory for storing the image data output from the reproduction unit;  
4           a controller for displaying the image data stored in the memory during a search mode in  
5 response to a search command to search for the image data recorded in the recording medium,  
6 and for displaying the image data recorded in the recording medium when the search mode  
7 finishes.

1           17. (Previously Presented) The reproduction apparatus as claimed in claim 16, wherein  
2 the controller stores the image data output from the reproduction unit in the memory for a  
3 predetermined time period in response to the search command.

1           18. (Previously Presented) The reproduction apparatus as claimed in claim 17, further  
2 comprising a display for displaying the image data.

1           19. (Previously Presented) The reproduction apparatus as claimed in claim 17, wherein  
2           the controller displays the image data stored in the memory for a search period.

1           20. (Previously Presented) The reproduction apparatus as claimed in claim 17, further  
2           comprising a motor for moving the recording medium, wherein the controller sets the motor to a  
3           first speed for the predetermined time period and to a second speed for a search period.

1           21. (Previously Presented) A method of processing a screen picture during a search,  
2           comprising the steps of:

3           reproducing image data recorded on a recording medium in a normal mode for a  
4           predetermined time period when a search command is applied;

5           storing the reproduced image data;

6           executing the search while the stored image data is displayed;

7           eliminating the image data being displayed if desired image data is searched for, and  
8           displaying the desired image data.

1           22. (Previously Presented) The method of processing a screen picture during a search as  
2           claimed in claim 21, further comprising the steps of:

3           determining whether display of the desired image data is completed and the search is to  
4           continue;

5 repeating the steps of executing, displaying, and determining when the display of the  
6 desired data is completed and the search is to continue.

1 23. (Previously Presented) The method of processing a screen picture during a search as  
2 claimed in claim 22, wherein executing the search comprises a step of preventing image data  
3 reproduced from the recording medium from being displayed during the search.

1 24. (Previously Presented) A reproduction apparatus, comprising:  
2 a reproduction unit that reproduces image data recorded on a recording medium;  
3 a switch that selects the image data output from the reproduction unit according to a  
4 control signal;  
5 a memory connected to the switch that stores the image data selected by the switch; and  
6 a controller for storing the image data reproduced by the reproduction unit in the memory  
7 for a predetermined time period in response to a search command to search for image data  
8 recorded on the recording medium, and for controlling the switch not to store the image data  
9 reproduced by the reproduction unit to the memory.

1 25. (Previously Presented) The reproduction apparatus as claimed in claim 24, wherein  
2 the controller controls the switch to display the searched for image data when the search is  
3 completed.

1           26. (Previously Presented) The reproduction apparatus as claimed in claim 25, wherein  
2           the controller controls the reproduction apparatus to continue the search when the display of the  
3           searched for data is completed.

1           27. (Previously Presented) The reproduction apparatus as claimed in claim 24, further  
2           comprising a motor for moving the recording medium, wherein the controller controls the motor  
3           to move the recording medium at a first speed for the predetermined time period and at a second  
4           speed after the predetermined time period.

1           28. (Previously Presented) The reproduction apparatus as claimed in claim 27, wherein  
2           the controller sets the speed of the recording medium at a first speed, and when desired image  
3           data is searched for, controls the switch to display the searched for image data.
